

Get the **Right Light** Output for Your Project

“Having to specify different luminaires for an open space and not knowing if I will get the desired uniformity.”

– IALD, Lighting Designer

Specifying multiple luminaires in a space can be a challenge. Lumen output uniformity can be a concern. Energy requirements may also create the need for custom wattages to be specified. Right Light™ technology mitigates those issues and allows to specify lighting with confidence, knowing it will meet the aesthetic and LPD requirements of the space. The cutting edge technology also supports future maintenance, especially of large or multi-phase projects, by providing a broad range of standard delivered lumen outputs that stay consistent as technology upgrades occur. Tunable drivers allow for custom wattage and lumen outputs to be specified within the standard range. Right Light technology is offered in a broad range of luminaires; suspended, downlight, wall mount, linear and recessed.

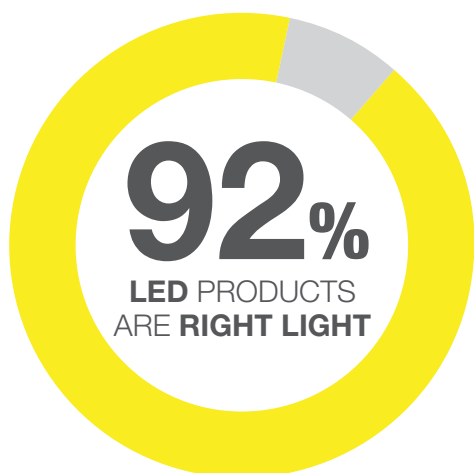

“I work on projects with strict energy usage requirements, I need to be able to adjust the wattage of the light sources to meet those parameters.”
